

mass transfer by diffusion pdf

Mass transfer is the net movement of mass from one location, usually meaning stream, phase, fraction or component, to another. Mass transfer occurs in many processes, such as absorption, evaporation, drying, precipitation, membrane filtration, and distillation. Mass transfer is used by different scientific disciplines for different processes and mechanisms.

In engineering, the mass transfer coefficient is a diffusion rate constant that relates the mass transfer rate, mass transfer area, and concentration change as driving force: $N = k_c A \Delta C$ Where: k_c is the mass transfer coefficient [$\text{mol}/(\text{s}\cdot\text{m}^2)/(\text{mol}/\text{m}^3)$], or m/s N is the mass transfer rate [mol/s] A is the effective mass transfer area [m^2]; ΔC is the driving force concentration difference [$\text{mol} \dots$]

4.1.1. Closing of the mould. The first step in the steam-chest moulding cycle is the closing of the mould.

4.1.2. Filling of the mould. Foamed beads are drawn by air pressure out of a container and blown into the mould by an injector, which usually functions according to the venturi-principle.
